

Thiru K

Principal Member of Technical Staff(PMTS)@athenahealth
B.E. Computer Science
Experience: 2007 - till date

About Me

An organized, detail-oriented and diligent professional with 17+ years of experience in all phases of SDLC in enterprise application development. Good hands on in designing and developing highly scalable, available, secured and fault tolerant enterprise applications. Clean code enthusiast and adherent follower of SOLID principle. Organized and dependable individual successful at multiple priorities with a positive attitude.

Age	39
Email	thiru.kuppusamy@gmail.com
Phone	+91-9952028912
Address	A2-502, Doshi Risington, OMR, Karapakkam, Chennai, Tamil Nadu - 600 097

Professional Skills

Backend-Coding

ECS, S3, RDS, GA, Lambda, IAM, Global Accelerators, Load Balancers

Git, Jenkins, Maven, SonarQube, Docker

Prometheus, Grafana, xMatters

Certification

AWS Certified Solution Architect Associate

PSM1 Certified Professional Scrum Master

Oracle Certified Associate

TOGAF Foundation Certified

Work Experience

Principal Member Of Technical Staff at athenahealth

Remit Tracking (Mar, 2023 - Present)

Re-architecture of remit tracking application by breaking it from monolith to microservices.

Technical Activities Undertaken:

- Worked closely with business/product team to create high level and low level design
- Adoption of various design patterns like factory pattern, adapter pattern and micro-kernel architecture to maintain scalability and maintainability of the code
- Spear headed the implementation(Spring-boot/AWS/React)
- Guided and mentored team in implementation
- Defined metrics to be monitored using Grafana dashboard and alerts to be notified through xmatters/teams
- Connected postgres application to data warehouse for reporting
- Defined RTO, RPO and Disaster Recovery with pilot light strategy
- Planned and executed live disaster testing in production
- Efficiently managed data storage in RDS using hot/cold partitions and reduced cost

Lead/Principal Member Of Technical Staff at athenahealth

Rules 2.0 Program - PMTS (Jan, 2022 - Mar, 2023)/LMTS (Aug, 2015 - Dec, 2021)

Rules 2.0 program is to rearchitecture almost 2 decades old rules engine based on PERL into decision based DMN engine. Leading 3 workstreams in Rules 2.0 program:

Technical Activities Undertaken:

PMTS:

- Created SDK(Spring-boot) to expose micro decisions (subset of rules) of Billing engine as micro service to be utilized in various points of revenue cycle
- Handled all non-functional requirements like monitoring, audit, logging, error handling and analytics in SDK to reduce the development time for exposing micro decisions
- Created strategy and design for moving away from legacy rule id to decision id in monolith application with backward compatibility. Introduced rules transformation life cycle to gracefully retire the rules in legacy rule engine
- Designed and implemented Advanced Rule Configuration page(UI) to configure practice level rules

LMTS:

- Collaborate with business team and architect to define high level design Rules 2.0 framework
- Initial POC for migrating rules in chunks to decision engine
- Strategize solution for migrating rules to decision engine
- Lead the implementation of Rules 2.0 framework

Tech Lead: at TCS Montreal-Canada

Dec, 2010 - Jul, 2015

Project: Voice Billing – GBS [2010 – 2015]

Global Billing System [GBS] is the Voice Switched services' billing system for the wholesale market for all former TELEGLOBE entities around the world. Processes the incoming traffic, rates the traffic and produces the invoice for the receivable services & declaration for the payable services.

Technical Activities Undertaken:

- Migrated the GBS applicaiton from Solaris to Linux. Completely owned the migration activity at client location
- Developed modules from scratch to integrate rates from interface applications into Billing System.
- Rearchitected GBS to use Efficient XML Interchange(EXI) format from fixed binary format. This reduced the overhead to add new fields to Call Detail Records(CDRs)
- Rearchitected Rating application to load rates into memory in an efficiently using multiple shared memory segments instead of single segment. This reduced the rate segment loading time from 4 hours to 30 minutes.

Developer: at TCS

Mar, 2007 - Dec, 2010

Project: Mediation – RECS [2007-2008]

Mediation RECS System is responsible for collecting the Raw CDR (Call Detail Record) files from the Network Elements, processing it and distributing to various Downstream Application Systems.

Technical Activities Undertaken:

- Developed RECS applications for 3 different switches in C.
- CDR files comes in different formats like BCD, HEX, little/big endian Binary. Worked with all these kind of files during initial years of my career.

Education

Bachelor of Engineering – Computer Science from Anna university

2002 - 2006
